The leading text and reference on radar cross section (RCS) theory and applications, this work presents a comparison of two radar signal strengths. One is the strength of the radar beam sweeping over a target, the other is the strength of the reflected echo sensed by the receiver. This book shows how the RCS "gauge" can be predicted for theoretical objects.

A practical book written for engineers who design and use antennas. The author has many years of hands-on experience designing antennas that were used in such applications as the Venus and Mars missions of NASA.
