Doping profiles are a key element in the development of modern semiconductor technology. This book is the first to give a comprehensive review of the theory, fabrication, characterization, and device applications of abrupt, shallow, and narrow doping profiles in semiconductors. After an introductory chapter sets out the basic theoretical and experimental concepts involved, the authors discuss the fabrication of abrupt and narrow doping profiles by several different techniques, including epitaxial growth. They then present the techniques for characterizing doping distributions, followed by several chapters on the inherent physical properties of narrow doping profiles. The latter part of the book deals with specific devices. The book will be of great interest to graduate students, researchers, and engineers in the fields of semiconductor physics and microelectronic engineering.

practical guide to internal photoemission (IPE) phenomena and measurements. The book's discussion of fundamental physical and technical aspects of IPE spectroscopic applications is supplemented by an extended overview of recent experimental results in swiftly advancing research fields. These include the development of insulating materials for advanced SiMOS technology, metal gate materials, development of heterostructures based on high-mobility semiconductors, and more. Recent results concerning the band structure of important interfaces in novel materials are covered as well. Internal photoemission involves the physics of charge carrier photoemission from one solid to another, and different spectroscopic applications of this phenomenon to solid state heterojunctions. This technique complements conventional external photoemission spectroscopy by analyzing interfaces separated from the sample surface by a layer of a different solid or liquid. Internal photoemission provides the most straightforward, reliable information regarding the energy spectrum of electron states at interfaces. At the same time, the method enables the analysis of heterostructures relevant to modern micro- and nano-electronic devices as well as new materials involved in their design and fabrication. First complete model description of the internal photoemission phenomena

Some architectural endeavours require more than designed beauty. Their purpose, in and of itself, requires repose, serenity, poetry. Estudio Ramos' Figueras Stables is just such a place; a respite from the everyday possessed of a deepseated relationship with its environment and an intuitive sense of purpose. 3850sq/m of stables are articulated in a long, volumetric space of mixed-use. Social spaces abut grooming and training facilities, sloped land ramps to a roof planted with wild grass, sheathing the building within its surroundings. Water, that universal symbol of life, purity, and harmony, is used to connect and articulate spaces. Much more than an aesthetic masterwork, Figueras Stable is a structure quietly and elegantly assisting a calling. One that Cormac McCarthy called 'seeing into a creature's soul and soothing the wounds found there. Secrets uttered softly into troubled ears'.
