If  $w$  has an odd number of 1's, then so does  $z$ . By the inductive hypothesis,  $\hat{\delta}(A,z) = B$ , and the transitions of the DFA tell us  $\hat{\delta}(A,w) = B$ . Thus, in this case,  $\hat{\delta}(A,w) = A$  if and only if  $w$  has an even number of 1's. Case 2:  $a = 1$ . If  $w$  has an even number of 1's, then  $z$  has an odd number of 1's.

Solutions for Section 7.2 Exercise 7.2.1(a) Let  $n$  be the pumping-lemma constant and consider string  $z = a^n b^{n+1} c^{n+2}$ . We may write  $z = uvwxy$ , where  $v$  and  $x$ , may be "pumped," and  $|vwx| \leq n$ . If  $vwx$  does not have  $c$ 's, then  $uv^3wx^3y$  has at least  $n+2$   $a$ 's or  $b$ 's, and thus could not be in the language.

Using Exercise 2.2.2,  $\hat{\delta}(q_0, x^k) = \hat{\delta}(\hat{\delta}(q_0, x^{k-1}), x) = \hat{\delta}(q_f, x)$  [by the inductive hypothesis] =  $q_f$  [by (a)]. Exercise 2.2.10. The automaton tells whether the number of 1's seen is even (state A) or odd (state B), accepting in the latter case.

## **Introduction To Automata Theory Solutions**

1.1.3 Automata theory Automata Theory deals with de?nitions and properties of di?erent types of “computation models”. Examples of such models are:

- Finite Automata. These are used in text processing, compilers, and hardware design.
- Context-Free Grammars. These are used to de?ne programming lan-guages and in Arti?cial Intelligence.
